# 3.10 Manual Solid Phase Extraction (SPE) Methods

3.10.4 Extraction and Quantitation of Cocaine and Cocaine Metabolites in Blood Employing the United Chemical Technologies (UCT) 200 mg CLEAN SCREEN® DAU Extraction Column

# 3.10.4.1 BACKGROUND

The major metabolites of Cocaine (Methylbenzoylecgonine (Figure 1)), are benzoylecgonine, ecgonine and ecgonine methyl ester, all of which are inactive. When cocaine is ingested with ethanol, the methyl ester portion undergoes transesterification to form the active compound Cocaethylene (ethyl benzoylecgonine) that in turn adds the inactive metabolite, ecgonine ethyl ester. Refer to qualitative urine cocaine analytical method 2.3.6 and provided references and current literature for information regarding the background and pharmacology of these compounds.<sup>2-8</sup>

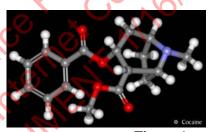

Figure 1.

# **3.10.4.2 PRINCIPLE**

This procedure is based on a method developed by United Chemical Technology (UCT) which applies the UCT 200 mg CLEAN SCREEN<sup>®</sup> extraction column for the extraction of blood for cocaine and cocaine metabolites. The CLEAN SCREEN<sup>®</sup> DAU column utilizes a copolymeric sorbent which combines a cationic exchanger and a hydrophobic functionality (reverse phase) to interact effectively, physically and chemically, with analytes of interest and minimally with interfering substances in the blood sample. The cation exchanger utilizes an anionic sorbent (-) to bind to cations. Additional retention mechanisms include hydrophobic interactions and polar adsorption.

For this extraction method, the blood sample is diluted and adjusted with a pH 6 phosphate buffer and any necessary tweaks with 100mM Monobasic sodium phosphate of 100mM Dibasic sodium phosphate. When the pH is optimal, the supernatant is loaded onto a pre-conditioned SPE column. The blood pH is adjusted to maximize the ionic character of the analyte. The conditioning creates an environment, which allows for optimal interaction between the sorbent and the analytes of interest. The analyte is retained by ionic interaction of the amine functional groups present on the drug and the

anionic sulfonic acid exchanger on the sorbent. The column is subsequently washed with water, 100mM hydrochloric acid, and methanol to selectively remove matrix components and interfering substances from the column. The wash also disrupts the hydrophobic and adsorption interactions but not the ionically bound material. Next, the column is dried to remove traces of aqueous and organic solvents. After drying the sorbent the analytes of interest are eluted from the column with a basic organic solvent mixture. Following the elution and evaporation of the solvent, the extract is derivatized for confirmation on the GC/MSD. Quantitation is accomplished using the corresponding deuterated internal standard to establish a response factor.

# 3.10.4.3 EQUIPMENT AND SUPPLIES

3.10.4.3.1	200mg CLEAN SCREEN® Extraction Column (ZSDAU020
	or ZCDAU020 or equivalent)
3.10.4.3.2	Drybath or laboratory oven
3.10.4.3.3	Evaporative concentrator equipped with nitrogen tank.
3.10.4.3.4	Vortex mixer
3.10.4.3.5	Vacuum manifold/pump
3.10.4.3.6	Laboratory centrifuge capable of 3400rpm
3.10.4.3.7	Fixed and adjustable volume single channel air displacement
	pipetters, and appropriate tips, capable of accurate and
	precise dispensing of volumes indicated.

3.10.4.3.8 pH indicator strips

3.10.4.3.9 16 x 100mm round bottom glass tube

3.10.4.3.10 Screw Cap for 16mm O.D. tube

3.10.4.3.11 GC/MS Automated Liquid Sample (ALS) vials

3.10.4.3.12 GC/MS Vial Microinsert

Gas Chromatograph (GC) equipped with a mass selective detector (MSD) (HP 6890 GC/5973 MSD or equivalent) and a nonpolar capillary column with a phase composition comparable to 100%-dimethylpolysiloxane or 95%-dimethylpolysiloxane with 5%-diphenyl.

### 3.10.4.5 **QUALITY ASSURANCE MATERIAL**

### 3.10.4.5.1 Calibrator and Control Solutions

Corresponding calibrator and control reference materials must be obtained from different vendors, or be from different lot numbers if suitable second vendors are not available. The addition of Cocaethylene is optional.

### **Reference Material Stock Solutions** 3.10.4.5.1.1

Compound	Concentration
Benzoylecgonine	1 mg/mL
Cocaine	1 mg/mL
Cocaethylene	1 mg/mL

Store remaining stock solution in freezer.

# **Reference Material Working Solutions**

Working solutions are stable for 6 months when stored under refrigeration.

# 10ng/mL

Add 100µL each Benzoylecgonine, Cocaine and Cocaethylene (optional) Stock Solutions to ≅9mL Methanol in a 10mL volumetric class A flask . QS to 10mL.

# $1 \text{ng}/\mu L$

Add 1mL 10ng/µL working drug solution to ≅5mL Methanol in a 10mL volumetric class A flask. QS to 10mL.

# Roperty of Idahoontille 3.10.4.5.2 **Internal Standard Stock Solutions**

Compound	Concentration
Benzoylecgonine–D <sub>3</sub> or –D <sub>6</sub>	100μg/mL (100ng/μL)
Cocaine–D3	100μg/mL
Cocaethylene–D3*	100μg/mL

<sup>\*</sup>Use if Cocaethylene will be included.

Rev. 3 Issued: 11/28/12 Blood Analytical Method - 3.10.4- Cocaine UCT SPE

Issuing Authority: Quality Manager

### 1ng/µL Working Internal Standard Solution 3.10.4.5.3

Add 100µL Benzoylecgonine–D<sub>3</sub> or –D<sub>6</sub>. Cocaine–D<sub>3</sub>, and Cocaethylene–D<sub>3</sub> stock solutions to 9800µL Methanol. Working solution is stable for 6 months when stored under refrigeration.

### 3.10.4.5.4 Commercial Whole Blood Controls

# **Negative Whole Blood**

# **Positive Whole Blood**

**Positive** minimum control must contain of Benzoylecgonine and Cocaine each at a target of 100ng/mL. Refer to package insert for verified value and expected range. Additional concentrations may also be utilized.

### 3.10.4.6 **PROCEDURE**

### 3.10.4.6.1 Initial set-up

For calibrators, controls and case samples label extraction tubes (two per sample), a 200mg CLEAN SCREEN® extraction column, eluate collection tube and a GC/MSD vial with microinsert.

### 3.10.4.6.2 Calibrator Preparation

Use the same lot of negative blood used to prepare the negative control to prepare calibrators.

Add 1mL of negative whole blood to six screw-top tubes.

3.10.4.6.2.1 3.10.4.6.2.2 Add the volume of working  $1 \text{ng}/\mu L$ Cocaethylene Benzoylecgonine, and Cocaine mixed reference material

indicated in the following table.

Level	ng/mL	μL Working Reference Material
1	25	25
2	50	50
3	100	100

3.10.4.6.2.3 Add the volume of working 10ng/µL Benzovlecgonine, Cocaethylene and Cocaine mixed reference material indicated in the following table.

> 4 of 13 Rev. 3

Level	ng/mL	μL Working Reference Material
4	250	25
5	500	50
6	1000	100

3.10.4.6.2.4 Additional or alternative concentrations may be used as necessary as long as the requirements in 3.10.4.6.15.1 are met.

### Positive Control Sample Preparation 3.10.4.6.3

Use the same lot of negative blood used to prepare the negative control for positive control preparation.

- Add 1mL of negative whole blood to two 3.10.4.6.3.1 screw top tubes.
- Add indicated amount of lng/µL working 3.10.4.6.3.2 mixed control solution.

Desired ng/mL		μL Working Control		
×	75	75		

Add indicated amount of 10ng/µL working mixed control solution.

	Desired ng/mL	μL Working Control
)	750	75

Additional or alternative concentrations may be used at the discretion of the analyst as long as the requirements in 3.10.4.10.2 are met.

# Negative Control Sample Preparation

Add 1mL of negative whole blood to screw top tube.

# Case Sample Preparation

- 3.10.4.6.5.1 Based on enzyme immunoassay screen results, samples may be diluted with negative whole blood for additional analysis.
- The total volume of blood or diluted blood 3.10.4.6.5.2 should be 1mL.
- 3.10.4.6.5.3 Place sample container on tube rocker for a minimum of five minutes. If sample is clotted, homogenize as necessary.

# Derivatization

- 3.10.4.6.13.1 In fume hood add  $50\mu L$  ethyl acetate. Vortex for  $\cong 15$  seconds.
- 3.10.4.6.13.2 Add  $50.0\mu$ L BSTFA + 1% TMCS.
- 3.10.4.6.13.3 Cap tubes and vortex briefly.
- 3.10.4.6.13.4 Place tubes in 70°C dry bath or oven for 20 minutes.
- 3.10.4.6.13.5 Remove from heat and allow to cool to room temperature.

3.10.4.6.13.6	Transfer	derivative	to	labeled	GC/MSD	
ALS vial with microinsert.						

# 3.10.4.6.14 Preparation for GC-MS Run

- 3.10.4.6.14.1 Perform an AUTOTUNE and TUNE EVALUATION.
- 3.10.4.6.14.2 When tune values are acceptable, program SEQUENCE TABLE with sample, calibrator and control information.
- 3.10.4.6.14.3 Load ALS vials into quadrant racks as indicated in the SEQUENCE TABLE.

# 3.10.4.6.15 GC-MS Calibration Curve

- 3.10.4.6.15.1 The calibration curve must be established with a minimum of four data points.
- 3.10.4.6.15.2 Calibrators should be analyzed in order of increasing concentration.
- 3.10.4.6.15.3 The least squares line resulting from the analysis of calibrators must have a coefficient of correlation of ≥0.98.
- 3.10.4.6.15.4 If calibrators are run in duplicate, it is not required that duplicate calibration points be included as long as the linearity requirement is met.

# 3.10.4.7 GC and MSD ACOUISITION PARAMETERS

Critical parameters are specified below. Parameters not specified are at the discretion of the analyst and should be optimized for the particular GC-MSD instrument. Each laboratory should maintain a centrally stored printed or electronic copy of current and past GC-MSD methods. The data supporting the GC-MSD method should be stored centrally.

3.10.4.7.1 GC Temperature Parameter

Injection Port: 250° or 260°C

3.10.4.7.2 MSD Instrument Parameters

Detector/Transfer Line: 280°C

3.10.4.7.3 ALS Parameters

Injection Volume: 1µL (1 stop)

Viscosity Delay: A minimum of 3 seconds

### 3.10.4.8 REPORTING CRITERIA

Qualitative Chromatographic and SIM Criteria 3.10.4.8.1

3.10.4.8.1.1

Qualitative results can be accepted when the following two criteria are met.

- The retention time falls within the  $\pm 0.2$ window established minute by calibrators.
- 2. Ion ratios for the analyte and its corresponding internal standard. established by calibrators for target and qualifier ions, do not differ by more than  $\pm 20\%$  (relative).

# Property of Idahoontr Quantitative Mass Spectral Criteria

9 of 13

- 3.10.4.8.2.1 Quantitative results can be accepted if the calculated concentration of all calibrator and control samples are within ±20% of their respective concentrations (relative).
- 3.10.4.8.2.2 Quantitation is achieved through the plotting of the target ion response ratio versus the concentration for each calibrator.
- 3.10.4.8.2.3 Quantitative values for case samples,

Rev. 3 Issued: 11/28/12 calibrators and controls will be truncated for reporting purposes.

3.10.4.8.2.4 Administrative limit of detection (LOD) for Benzoylecgonine, Cocaine and Cocaethylene is 25ng/mL. Results < this LOD should be reported as negative unless there are extenuating circumstances. The Toxicology Discipline Leader must be consulted to evaluate exceptions.

3.10.4.8.2.5 If the concentration exceeds the calibration range, the sample must be appropriately diluted with negative whole blood for reanalysis.

# 3.10.4.9 REPORTING OF RESULTS (?)

3.10.4.9.1 This method is currently only approved for the qualitative identification of drugs. Quantitative values are not to be reported or expressed. They are currently being used to establish an administrative cut off. Once the uncertainty of measurement is established for this method it will be evaluated for quantitative reporting.

# 3.10.4.10 QUALITY ASSURANCE REQUIREMENTS

3.10.4.10.1 General

3.10.4.10.1.1 Blood samples are to be stored under refrigeration after aliquots are removed for analysis.

3.10.2.10.1.2 Refer to toxicology manual section 5.1 for pipette calibration and intermediate check options.

3.10.2.10.1.3 Refer to toxicology manual section 5.2 for balance calibration and intermediate check requirements.

3.10.2.10.1.4 Refer to toxicology manual section 5.8 for additional GC-MSD quality assurance requirements.

3.10.2.10.1.5 Refer to toxicology manual section 5.10 for reference material authentication requirements.

10 of 13 Rev. 3

Issued: 11/28/12

Blood Analytical Method - 3.10.4- Cocaine UCT SPE Issuing Authority: Quality Manager

# 3.10.4.10.2 Per Analysis Run Quality Requirements

- 3.10.4.10.2.1 A solvent blank must follow the highest calibrator, as well as precede each case sample.
- 3.10.4.10.2.2 A minimum of the spiked blood controls described in section 3.10.4.6.3 must be run per batch of samples.
- 3.10.4.10.2.3 If the number of case samples exceeds 10, in addition to the two spiked described in 3.10.4.6.3, one blood spiked or commercially obtained control must be run for each additional 10 case samples,. Additional concentrations may be used.

# 3.10.4.10.3 <u>Monitoring of Control Values</u>

Upon the completion of analysis, input blood control values on spreadsheet used to assess uncertainty for this method.

# 3.10.4.11 ANALYSIS DOCUMENTATION

- 3.10.4.11.1 A packet containing original data for controls and standards will be prepared for each analysis run and stored centrally in the laboratory where the analysis was performed until archiving.
- 3.10.4.11.2 A copy of controls and standards need not be included in individual case files. When necessary, a copy of the control and standard printouts can be prepared from the centrally stored document.
