Revision History

Revision #	Description of Changes
1	Ready for Qualtrax – no content changes
2	Updated introduction to include requirements for DNA Database Card Comparisons; added Module 33: DNA Database Fingerprint Comparisons, added practical exercises for ThermaNin and 1,2, Indanedione TP and associated readings in appendix I
3	Break out modules for Latent Print Field Service Response and ABIS; further define general grading policy and applicability to individual assignments; slight wording and grammatical changes throughout.
4	Numbered practical exercises, modified introduction, removed Introduction to Crime Scenes unit, combined Taking Post Mortem Exemplars with unit on processing bodies for latent prints into new module - Advanced Latent Print Field Service Response, updated numbering, added readings to modules: 6, 14, 20, & 31, removed one reading from module 4, slight wording and grammatical changes throughout.
5	Convert to pdf following automated conversion system error - no other changes were made
6	Corrected info on Vucetich in Module 1, added written test for module 31, added/modified readings in modules 4, 28, & 29, slight wording and grammatical changes throughout.
7	Minor wording changes throughout, added sign offs for exercises, updated background in module 7 updated objectives in modules 1, 5, 7, & 24 updated practical exercises for modules 1-27, & 29, updated readings for modules 1, 3, 5- 21, 25, & 32. Removed KSI from ALS module.
8	Minor wording changes throughout; changed ABIS to MBIS throughout, added column for written test grades; updated sections 6.4.2, 7.4.5, 16.3.1, 16.3.2, 18.4.3, 24.2.2, 32.4.2; updated title 11.0, 16.0, & 20.0; added sections 11.3.7, 11.3.8, 16.3.5-16.3.7, 31.4.13; removed Module 30.0 Advanced latent Print Field Service Response and associated readings and associated references; and updated readings in modules 5, 7, 9, 14, 16, 18, 20, 29 & 30.

Latent Print Examiner Training Manual

1.0 Introduction

The purpose of this manual is to provide an in-house training program that will result in a competent and qualified expert Latent Print Analyst. This expert shall possess specialized knowledge, skills and training in the sub-disciplines of Latent Print Processing and Latent Print Comparison. In addition to establishing a minimum standard of professional competency, completion of this manual shall aid in maintaining quality and consistency among analysts within the section.

The training program, in its entirety, is designed for the Trainee who has little to no prior background or experience in the subject matter. The training program consists of two main segments: Latent Print Processing and Latent Print Comparison and two supplementary modules: Multimodal Biometric Identification System and DNA Database Card Comparison that may be used depending on work duties. Each segment is composed of a series of modules on specific topics. These modules consist of reading materials, observation and demonstration, and/or practical exercises. Each module has an associated test. Module tests shall evaluate the ability of the analyst to properly perform examinations and may be written, oral, hands-on or a combination thereof. They shall not be reviewed or verified prior to submission to the Trainer.

The modules outlined are the minimum requirements for completion of training. Additional exercises or readings may be assigned at the discretion of the Technical Lead, if necessary. The training may be abbreviated for analysts with prior experience and training or for those individuals who perform only limited duties. The background and experience of each individual will be assessed by the Technical Lead prior to the analyst beginning the training program. Training modules do not need to be completed in sequence. The order of completion may vary depending on the Trainee and/or operational needs.

All cases processed and examinations performed during training will be with the Trainee working as "the hands of the Trainer" as defined by the ISPFS Quality/Procedure Manual.

External training is used to supplement and/or meet certain portions of the training program. Trainees should attend workshops and/or training classes in the areas of latent print processing, latent print comparison, courtroom testimony, digital imaging, and photography. Attendance of outside training courses/workshops is subject to course availability and budget constraints. Requests for training shall be approved through the chain of command.

Progress is monitored by the Trainer, who reports to the Technical Lead and/or Supervisor. The Trainee must pass each written test with a minimum score of 80%. All tests are closed book unless otherwise noted. Many practical exercises require that the Trainee search out or participate in a particular activity. These exercises are not graded Latent Print Examiner Training Manual Revision 8 and the Trainee or Trainer need only to document the date of occurrence. Other practical exercises will be graded "pass" or "fail" as noted. In order to receive a passing mark, the Trainee must demonstrate comprehension of the subject and demonstrate to the Trainer that they are able to complete the assignment with satisfactory results. If a practical exercise is assessed as "fail" the Trainee will be given additional training and/or additional exercises until competency is achieved. The Trainee must pass a final competency test and mock court in each of the sub-disciplines: Latent Print Processing and Latent Print Comparison. Competency tests and mock courts are also "pass" or "fail". Should the Trainee provide incorrect results or inaccurate testimony during these exercises additional training or testing will be necessary and mock courts may be repeated. Training is considered complete upon formal approval by the Quality Manager. This training program is estimated to last 18-24 months. The actual pace of instruction is dictated by agency resources and needs, as well as the Trainee's progress and demonstrated proficiency.

Trainer

Latent Print Examiner Training Manual

2.0 Roles and Responsibilities

2.1 Supervisor

The Supervisor shall maintain an employee training file with all associated authorizations and shall evaluate mock court testimony.

2.2 Technical Lead

The Technical Lead shall assess any prior applicable training, review and/or modify the current training plan to reflect the analyst's prior training, assign the appropriate modules, and organize the training. The Technical Lead should regularly monitor the Trainee's progress and review their training record for completeness and accuracy, procure final competency tests, and schedule mock courts. The Technical Lead shall provide input regarding mock court performance to the Supervisor and/or other members of management. At the completion of Latent Print Processing and/or Latent Print Comparison training, the Technical Lead shall review all documentation regarding training to determine if the Trainee performed all required training and is competent to perform analysis. If the Trainee is competent to perform analysis, the Technical Lead shall forward all required documentation to the Quality Manager. The Technical Lead may designate an onsite Trainer.

2.3 Trainer

The Trainer shall provide a copy of the training plan to the Trainee with an anticipated timeline for completion. The Trainer is responsible for coordination of practical exercises, demonstrating techniques, reviewing assignments, providing feedback, and administration of module tests. The Trainer should monitor for comprehension and competency in theoretical knowledge and basic practical skills. The Trainer shall communicate progress, delays, or the need for supplemental activities to the Technical Lead and/or Supervisor. Deficiencies should be openly discussed among the Trainee, Trainer, Technical Lead and/or Supervisor in an attempt to rectify them.

2.4 Trainee

The Trainee shall maintain a record of training. This record shall include, but is not limited to: daily training received, observed events, activities performed by the Trainee, court testimony observed or performed, field cases observed or performed, completed assignments, and checklists. All steps in training shall be documented as they are completed. The record shall include a list of training samples that are utilized for hands-on processing exercises as well as the methods used to process them. With regards to comparison and/or MBIS training, the record will include a list of cases utilized as practical comparison exercises and

Latent Print Examiner Training Manual Roles and Responsibilities

Revision 8 Issue Date: 12/29/2021 Page 9 of 104 Issuing Authority: Quality Manager

associated statistics (number of latent prints examined, number of comparisons performed, and number of identifications). The ILIMS training program may be utilized to record events or specific conclusions during training.

The Trainee should provide a weekly report to the Technical Lead and/or Trainer to include activities accomplished during the week (readings/exercises completed, casework observed, classes attended, etc.). They should keep the Technical Lead and/or their Trainer informed of any problems or questions that may arise.

At the completion of the Latent Print Processing or Latent Print Comparison segment, the Trainee will advance to supervised case work. Supervised case work will not commence until approval has been granted by the Quality Manager. At such time, a record of all cases, associated statistics, and the identity of the supervising analyst will be kept for all Latent Print Processing or Latent Print Comparison supervised case work.

The Trainee shall ensure that all training records for outside classes are forwarded to the Quality Manger for inclusion in his/her training file and shall ensure that their curriculum vitae accurately reflects successfully completed training.

Latent Print Examiner Training Manual Roles and Responsibilities

3.0 Module 1: History and Background of Fingerprint Identification

3.1 Background and Theory

Fingerprint identification has been relied upon for over 100 years to provide accurate identification. Fingerprints were originally used as signatures when signing business transactions and official government documents. In 1686, Professor Malpighi at the University of Bologna in Italy made observation of spirals, loops and ridges in fingerprints using the newly invented microscope. In 1858, Sir William Herschel was using fingerprints to "sign" documents. It was during this time that he noticed that no two prints were exactly alike and realized that they could be used for personal identification purposes. In the 1880's Henry Faulds was studying the permanency of friction ridge skin and was the first to publicly suggest that fingerprints could be used to identify criminals.

In 1888, Sir Francis Galton became the first person to provide evidence that no two fingerprints were exactly the same and that the prints remain the same throughout a person's lifetime. He calculated that the odds of finding two identical fingerprints were 1 in 64 billion. He went on to publish the first book on the subject titled "Finger Prints" in 1892, in which he detailed the first classification system for fingerprints. In his book, he identified three pattern types (loop, whorl, and arch).

In South America, Juan Vucetich developed his own system of classification by 1891 and published a book "Comparative Fingerprinting" (Dactiloscopia Comparada) in 1904. The first criminal fingerprint identification in a murder investigation came in 1892 by Police Inspector Alvarez, an Argentine police official trained by Vucetich.

In 1896, Sir Edward Richard Henry created a fingerprint classification system of his own in British India, which later spread to England. The Henry Classification system was used to establish a Fingerprint Bureau at Scotland Yard.

In 1902, New York was the first state in the United States to start implementing the new fingerprint technology. Within the next year, law enforcement agencies and military branches all over the United States started implementing their own identification departments.

Between 1911 and 1914, Edmund Locard established the first set of rules for fingerprint identification. Locard claimed that if there were 12 points of

Latent Print Examiner Training Manual Module 1: History and Background of Fingerprint Page 11 of 104 Identification Revision 8 Issue Date: 12/29/2021 Issuing Authority: Quality Manager agreement between prints with no disagreements, the identity was confirmed beyond doubt. This standard was formally adopted in many countries except for the United States who moved away from a standard based on counting points.

By the 1990's, Automated Fingerprint Identification Systems (AFIS) were being widely used. Currently, tens of thousands of individuals are added to repositories daily. These fingerprint collections provide the basis for criminal history records maintained by local, state, and federal law enforcement agencies.

The basic methodology for fingerprint identification has remained relatively unchanged. As other disciplines of forensic science continue to develop accurate statistics for their results, fingerprint identification seeks to quantify their own results. While still in its infancy, studies are beginning to surface based around this type of research.

- 3.2 Objectives, Principles, and Knowledge
 - 3.2.1 Understand the purpose of early methods of personal identification (Bertillon system, photography, scars, tattoos, sight recognition, marks, and mutilations).
 - 3.2.2 Knowledge of the earliest recorded awareness of fingerprints (cliff dwellers-Chinese) and be able to recall the earliest known uses of friction ridge impressions as a means of identification in China, Japan, and India.
 - 3.2.3 Knowledge of early anatomical observations (Grew, Malpighi, Purkinje, et. al.) and understand the biological significance of friction skin ridge patterns and their formation.
 - 3.2.4 Understand the scientific observations and use of fingerprints leading to modern fingerprint identification. Be able to recall the contributions of notable fingerprinting pioneers to include: Locard, Herschel, Faulds, Galton, Vucetich, Henry, Holland, Cummins, and Ashbaugh.
 - 3.2.5 Knowledge of the historical events that led to the introduction and use of fingerprints in England (Belper Committee, Troup Committee) and in the United States (Thompson, Twain, DeForest, Ferrier, NY Prison System, Will/William West, establishment of the FBI Identification Division).
 - 3.2.6 Knowledge of the current criminal and civil applications of fingerprints, palm prints, and footprints and how these applications developed in the United States.
 - 3.2.7 Knowledge of the existence and development of various criminal and civil fingerprint files (FBI, U.S. military medical records, state and local fingerprint and palm print repositories).
- 3.3 Health and Safety Hazards
 - 3.3.1 N/A

Identification		

4.0 Module 2: Other Scientific Personal Identification Methods

4.1 Background and Theory

Great strides have been made with regards to personal identification methods. In the late 1800's to early 1900's, agencies relied upon various methods of personal identification, including photography and anthropometry. The most common of these was the Bertillon method that utilized a person's physical measurements to prove identity. Those systems were replaced in the early 1900's by fingerprint identification. While fingerprint identification is still the most widely used system for personal identification, there are a number of other current personal identification methods of which a practitioner should be aware. These include DNA, odontology, handwriting and voice analysis, as well as various biometric techniques. Biometric verification is becoming increasingly popular in corporate and public security systems due to the rise in security breaches and transaction fraud. Biometrics use distinctive, measureable, physical, and behavioral characteristics to differentiate individuals. The physical characteristics used for biometric authentication include fingerprints, palm veins, facial recognition, DNA, palm print, hand geometry as well as iris or retina recognition. This information is often interpreted by a computer system that confirms identity.

4.2 Objectives, Principles, and Knowledge

- 4.2.1 Awareness of personal identification methods other than friction ridge skin to include biometrics, iris recognition, face recognition, vascular pattern recognition, hand geometry question document analysis, voice analysis, odontology, and DNA.
- 4.2.2 Awareness of the advantages/disadvantages of each.

5.0 Module 3: Safety Training

5.1 Background and Theory

Safety in the laboratory is an essential part of the job of a Forensic Scientist. The Occupational Safety & Health Administration (OSHA) was created in 1970 to protect workers. It mandates that each laboratory worker be knowledgeable about blood borne pathogens, chemical hygiene, universal precautions, biohazard disposal, decontamination, and vaccinations. It requires that all of the applicable information for the lab is given to the employee so that they may maintain safety in the workplace. It is also imperative that employees are able to access the Safety Data Sheets (SDS) in their laboratory in order to maintain safety around applicable chemicals.

- 5.2 Objectives, Principles, and Knowledge
 - 5.2.1 Understand safety hazards associated with the latent prints laboratory.
 - 5.2.2 Knowledge of spill procedures/equipment and the use of personal protective equipment.
 - 5.2.3 Knowledge of the potential explosion, fire, and contamination safety hazards associated with latent print development powders, solvents and chemicals.
 - 5.2.4 Proper disposal of chemicals.
- 5.3 Health and Safety Hazards 5.3.1 N/A
- 5.4 Reading and Practical Exercises
 - 5.4.1 Complete Module 3 Reading List

Trainee

Trainer Date

5.4.2 Practical Exercise I - Trainer led session on section safety equipment (location of Safety Data Sheets, spill kits, eye washes, fire extinguishers); chemical storage and disposal; and forms and labeling requirements (bottle labels, hazard labels, reagent logs, equipment maintenance logs, control test logs, image deletion logs, etc.). The trainee shall demonstrate this knowledge by guiding the Discipline Lead or designee on a tour of the above listed items and showing them how/where to access the items. Pass/Fail.

		Trainee	Trainer	Date	Grade

Latent Print Examiner Training ManualRevision 8Module 3: Safety TrainingIssue Date: 12/29/2021Page 16 of 104Issuing Authority: Quality Manager

6.0 Module 4: Case Management and Reporting for Processing

6.1 Background and Theory

In forensic science, it is imperative that procedures are accurately followed and documented appropriately. All documentation done for a case is subject to scrutiny by peers, the laboratory system, the courts, and accrediting bodies. Documentation should be as precise and error-free as possible.

It is important that measures are taken to prevent loss, deleterious change or tampering of evidence. Evidence should be tracked both internally (within the lab) and externally, as it transitions from agency to agency or person to person. This is done through chain of custody. When in the custody of an analyst, evidence integrity shall be ensured by properly securing, processing, marking, documenting, and re-sealing the evidence.

The system that is used to track information regarding a case is the Idaho Laboratory Information Management System (ILIMS). This system includes the internal chain of custody, information given to ISPFS by the submitting agency regarding the case, case correspondence, analyst generated notes and/or photographs, and all reports generated in relation to the evidence. The ILIMS system was implemented in 2013 to make all evidence processing paperless, efficient, and to afford timely access of records to submitting agencies and officers of the court. Comparison quality images are maintained in the Foray Digital Workplace database.

6.2 Objectives, Principles, and Knowledge

- 6.2.1 Knowledge of, and the ability to demonstrate, proper procedures for maintaining chain of custody (documentation and physical control).
- 6.2.2 Knowledge of, and the ability to demonstrate, proper procedures for handling and marking physical evidence received for examination.
- 6.2.3 Ability to navigate and query ILIMS for latent print processing cases.
- 6.2.4 Ability to demonstrate proper procedures for documentation of latent print processing casework. Documentation shall be such that another qualified Latent Print Examiner could evaluate what was done and why.
- 6.2.5 Understand how to prevent contamination.
- 6.2.6 Knowledge of, and the ability to demonstrate, proper procedures for reporting latent print processing examination findings in an accurate, concise, and clear manner.
- 6.2.7 Understand release of information policies, i.e. with whom, when, and how results may be given to customers.

7.0 Module 5: Digital Preservation of Latent Prints

7.1 Background and Theory

Photography is widely used in Forensic Science. It dates back to the 1800s, when collections of photographs of criminals would hang in police stations for identification purposes. Today, we use digital photography for documentation of crime scenes, victim injuries and/or death, retrieval of evidence, and preservation of evidence. Digital cameras contain a sensor that records color and brightness values. These values are stored electronically and interpreted by computers. In general, the higher the resolution, the more information captured.

As with other evidence related to a case, evidentiary photographs should be properly captured, stored, and tracked to ensure their admissibility in court. Photography may be utilized at any point in the processing of evidence for latent prints, e.g. overall documentation of the evidence item, photographs of particular latent prints, to show orientation on an object, or final condition of an item. When photographing latent print evidence for comparison purposes, it is important to include both the impression and a scale. A variety of photographic techniques may be employed and will depend largely on the substrate as well as the particular development technique utilized on the item. Some of these techniques will require the use of an alternate light source (ALS) and specialized camera filters.

7.2 Objectives, Principles, and Knowledge

- 7.2.1 Understand the proper procedures for camera capture and digital scanning of latent and inked print images.
- 7.2.2 Familiarization with common digital photography terminology to include camera parts (body, lens, shutter diaphragm and shutter release) and function, file types (JPEG, RAW, TIF), compression, resolution, depth of field, bracketing, f-stop, shutter speed, aperture, exposure, etc.
- 7.2.3 Understand the different types of cameras and their suitability for latent print photography.
- 7.2.4 Understand the interplay between aperture and depth of field, aperture and shutter speed, and ISO. They shall know how to change these settings and why it may be applicable to do so.
- 7.2.5 Knowledge of and ability to apply special requirements for category 1 vs. category 2 images.
- 7.2.6 Understand the properties of light and how those properties relate to the use of filters and lighting techniques (oblique lighting, diffuse lighting, co-axial lighting, ALS lighting with appropriate filters, bounce lighting, etc.)
- 7.2.7 Ability to photograph chemically treated and powder developed latent prints of various colors.

Latent Print Examiner Traini	ing Manual	Revision 8
Module 5: Digital Preservation		Issue Date: 12/29/2021
of Latent Prints	Page 20 of 104	Issuing Authority: Quality Manager
	All printed copies are uncon	trolled

- 7.2.8 Ability to photograph three dimensional impressions (plastic prints).
- 7.2.9 Use and maintenance of cameras and other equipment.
- 7.3 Health and Safety Hazards
 - 7.3.1 As with all electrical appliances, guard against electrical shock. This can be accomplished by ensuring that all connections are proper and that no loose, damaged, or frayed wires exist. Make sure the camera, scanner, and/or ALS is unplugged before attempting any maintenance and do not use outdoors if wet conditions exist.
 - 7.3.2 The eyes are generally more vulnerable than the skin, and appropriate eye protection must be used to protect them. Permanent eye damage can occur from reflected, refracted, or direct illumination to the eye. Most of the light emitted by an ALS is not absorbed, but is reflected and scattered off the surface being examined. Extreme care should be taken around highly reflective surfaces. Never look directly into the light or allow beams to bounce off the surface into your eyes or the eyes of another person in the vicinity. Filtered goggles or shields shall be utilized when using this equipment as they provide protection from potentially harmful rays and provide additional enhancement for viewing latent prints.
 - 7.3.3 The nature and extent of all potential hazards are not yet known because indepth assessments have not been made on most of the high intensity light sources used in forensic identification work.

Issue Date: 12/29/2021 Issuing Authority: Quality Manager

Module 6: General Latent Print Processing 8.0

8.1 Background and Theory

Latent print visualization may be achieved using various visual, physical, or chemical processes, most of which have evolved during the past century. There are three types of friction ridge impressions; latent, patent, and plastic. Latent prints are hidden until a physical or chemical process makes them visible. Although latent means hidden, it has become synonymous will all types of crime scene and evidence impressions. A patent print is a visible print. Examples of patent prints may be those left in blood, paint, dust, etc. A plastic print is a threedimensional print, for example, those left in clay, wax, melted plastic, or tacky paint.

Prior to any latent print processing, a thorough visual inspection of the evidence should be conducted, using a strong light source.

Deciding what technique(s) to use to develop latent print evidence depends on several factors including: type of latent print residue, type of substrate, texture of substrate, condition of substrate (clean, dirty, sticky), known environmental conditions during or following latent print deposition, length of time since deposition, consequences of destructive processing methods, subsequent forensic examinations, and sequential ordering of reagents/development techniques.

8.2 Objectives, Principles, and Knowledge

- 8.2.1 Knowledge of the generally accepted techniques for the detection and visualization of friction ridge impressions.
- 8.2.2 Knowledge of latent print residue components targeted by different chemical development procedures.
- 8.2.3 Ability to assess the effectiveness and results of applied processing techniques.
- 8.2.4 Understand generally accepted preservation methods for friction ridge impressions.
- 8.2.5 Knowledge of surface and environmental factors affecting selection and sequencing of chemical development procedures.
- 8.2.6 Knowledge of the effects of various solvents on evidence surfaces (inks, plastics, varnishes, etc.).
- 8.2.7 Knowledge of equipment maintenance relative to chemical development of latent prints.

8.3 Health and Safety Hazards

8.3.1 N/A

8.4 Reading and Practical Exercises

- 8.4.1 Complete Module 6 Reading List
- Trainee Trainer Date 8.4.2 The Trainee should attend a Latent Fingerprint Processing/Chemical course (36 hour minimum - attach certificate when completed). Trainee Trainer Date 8.4.3 Practical Exercise I - Locate two articles regarding the water content of fingerprints (the more recent the better). Consider how the information regarding this topic has changed. Prepare a talk, power point, or poster that will allow you to present your findings to the section. Pass/Fail. Trainee Trainer Date 8.4.4 Practical Exercise II – Devise a sequential processing plan on how you might process each of the following items: a smooth river rock, a dark colored glossy magazine page, a tree branch with bloody impressions. Present your ideas to your trainer and explain your reasoning for why you chose that particular sequence. Pass/Fail. Trainee Date Trainer 8.5 Written Test – Module 6
- 8.6 Processing Competency Test- Trainee will independently process a mock case. A minimum of two item types will be processed using sequential processing. This competency test will be entered into ILIMS, and as such, Trainee will need to complete all appropriate documentation and attachments, and issue a report.

Trainer

Trainee

8.7 Supervised Cases – Complete 20 Supervised Processing Cases. Trainee shall record all case numbers, associated stats, and the identity of the supervising analyst.

Trainee Trainer Date Grade

Date

9.0 Module 7: Processing Technique – Alternate Light Sources

9.1 Background and Theory

Visible light consists of electromagnetic radiation of differing colors and wavelengths. Wavelengths at approximately 700 nm are viewed as red light while wavelengths approximate to 400nm are viewed as violet light. To visualize latent prints via fluorescence, a specific wavelength of radiation is absorbed by either an untreated latent print or one treated with a fluorescent chemical or powder and then re-emitted at a differing wavelength. The wavelengths chosen on the Alternate Light Source (ALS) may be determined by the inherent luminescent nature of the print, the specific chemical or powder utilized for processing, or the luminescent nature of the substrate. Evidence is viewed and photographed with various filters dependent upon the specific wavelength used.

9.2 Objectives, Principles, and Knowledge

- 9.2.1 Knowledge of luminescence, fluorescence, inherent luminescence, light wavelengths, band-pass filters, and light delivery systems as they relate to ALS detection of latent prints.
- 9.2.2 Knowledge of dye stain procedures used post-cyanoacrylate and the need for ALS processing.
- 9.2.3 Knowledge of 1, 8-Diazafluoren-9-One (DFO), 1, 2 Indanedione, and the need for ALS processing.
- 9.2.4 Knowledge of equipment maintenance relative to ALS detection of latent prints.

9.3 Health and Safety Hazards

- 9.3.1 As with other electrical appliances, guard against electrical shock. This can be accomplished by ensuring that all connections are proper and that no loose, damaged, or frayed wires exist. Make sure the ALS is unplugged before attempting any maintenance and do not use outdoors if wet conditions exist.
- 9.3.2 The eyes are generally more vulnerable than the skin, and appropriate eye protection must be used to protect them. Permanent eye damage can occur from reflected, refracted, or direct illumination to the eye. Most of the light emitted by an ALS is not absorbed, but is reflected and scattered off the surface being examined. Extreme care should be taken around highly reflective surfaces. Never look directly into the light or allow beams to bounce off the surface into your eyes or the eyes of another person in the vicinity. Filtered goggles or shields shall be utilized when using this equipment as they provide protection from potentially harmful rays and provide additional enhancement for viewing latent prints.

10.0 Module 8: Processing Technique – Amido Black

10.1Background and Theory

Blood is composed of red blood cells, white blood cells and platelets, suspended in plasma. Red blood cells contain hemoglobin, a protein that carries oxygen from the respiratory organs to the remainder of the body. This protein is made up of four heme groups. There are two types of blood enhancement methods used in forensics: ones that react with the heme group to imply that blood is present and ones that react with proteins and their breakdown products. The methods that react with proteins are not specific to blood, but still tend to be sensitive methods due to the quantity of protein and protein breakdown products available in blood. Amido Black is a stain used in the latent print section to enhance the protein component of bloody prints. If blood is suspected, other presumptive blood testing techniques may need to be utilized.

10.2 Objectives, Principles, and Knowledge

- 10.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- 10.2.2 Demonstrate proper chemical application and preservation of developed prints.
- 10.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

10.3 Health and Safety Hazards

- 10.3.1 Gloves, lab coats, goggles, and respirators (if there is a chance of the reagents becoming airborne) are worn when mixing or using Amido Black.
- 10.3.2 Glacial acetic acid is corrosive and extremely irritating to the eyes and respiratory system. Avoid breathing the vapors and use in a fume hood, with a respirator, or with adequate ventilation. Glacial Acetic Acid will cause burns if it comes in contact with skin.
- 10.3.3 Methanol is flammable. It needs to be handled carefully with gloves during the mixing and use of Amido Black. Methanol is toxic in quantities as small as 30 ml and should not be allowed to come in contact with the skin, eyes, or mouth. It is possible for methanol to be absorbed through the skin. If methanol comes into contact with the eyes or mouth, the area should be flushed with generous amounts of water and a doctor may be consulted. Inhalation of methanol vapors should be kept at a minimum and the solution should be used in a hood or well-ventilated area.In addition, analysts must be aware of the biological hazards associated with blood and other body fluids and take extra precautions to protect themselves.

11.0 Module 9: Processing Technique – 1, 8-Diazafluoren-9-One (DFO), 1, 2 – Indanedione, and 1, 2 Indanedione TP

11.1 Background and Theory

1, 8-Diazafluoren-9-one (DFO) was originally prepared in 1950, but its reaction with amino acids was not explored until 1990, when it was first used as a fingerprint development reagent. It was observed that the application of DFO resulted in pink fingerprints that fluoresced. Fluorescence occurs when energy is supplied by an external source (in this case, an ALS) and is absorbed by a fluorescent chemical, creating an excited electronic state. In an effort to return to its ground state, the chemical emits energy that can be visualized as fluorescence. DFO fluoresces when illuminated between 450nm-570nm. The reagent is now widely used to develop fingerprints composed of amino acids on porous surfaces.

The fingerprint developing qualities of 1, 2-Indanedione were first reviewed after a related compound, (6-methyl-thio-1, 2-indanedione) was found to produce fluorescent fingerprints. 1, 2-Indanedione was found to produce fingerprints similar to DFO. Prints treated with this chemical fluoresce when exposed to wavelengths of 450-570nm. As with DFO, 1, 2-Indanedione reacts with the amino acids present in fingerprints and is utilized on porous surfaces.

Special formulations of 1, 2-Indanedione have been created that allow for use on thermal papers. These formulations do not utilize an external heat source, decreasing the darkening of the substrate.

11.2 Objectives, Principles, and Knowledge

- 11.2.1 Basic knowledge of the chemicals, the latent print matrices with which they react, potential safety hazards, and appropriate substrates for use.
- **11.2.2** Demonstrate proper chemical application and preservation of developed prints.
- 11.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

11.3 Health and Safety Hazards

11.3.1 DFO has not been fully investigated for potential health hazards, but is thought to be similar to ninhydrin, which may act as an irritant. Gloves, lab coats, and safety glasses should be worn when mixing and using DFO. The application of the DFO working solution should be performed in a fume hood, well-ventilated

Latent Print Examiner Training ManualRevisioModule 9: ProcessingIssue DTechnique – 1, 8-Diazafluoren-Page 29 of 1049-One (DFO), 1, 2 –Indanedione, and 1, 2Indanedione TPIndanedione TP

- 11.3.2 Glacial acetic acid is *corrosive* and extremely irritating to the eyes and respiratory system. Avoid breathing the vapors and use in a fume hood or with adequate ventilation. Glacial acetic acid will cause burns if it comes in contact with skin.
- 11.3.3 Methanol needs to be handled carefully with gloves during mixing and use. Methanol is toxic in quantities as small as 30 ml and should not be allowed to come in contact with the skin, eyes, or mouth. It is possible for methanol to be absorbed through the skin. If methanol comes into contact with the eyes or mouth, the area should be flushed with generous amounts of water and a doctor may be consulted. Inhalation of methanol vapors should be kept at a minimum.1,2 Indanedione may be harmful by: inhalation, ingestion and skin absorption. May cause skin and eye irritation.Zinc chloride is hazardous. Avoid contact with skin and eyes. It is a known irritant, a permeator and is corrosive. It is classified as a possible human mutagen.
- 11.3.6 Dichloromethane (Methylene Chloride) is hazardous. Avoid contact with skin and eyes. It is a known irritant, permeator and corrosive. Inflammation of the eye is characterized by redness, watering, and itching. It is classified as a possible human carcinogen.
- 11.3.7 Ethyl Acetate is hazardous by ingestion or inhalation and slightly hazardous in case of contact with skin or eyes. The substance is toxic to mucous membranes and the upper respiratory tract. Repeated or prolonged exposure to the substance can produce blood, kidneys, liver, or the central nervous system (CNS) damage.
- 11.3.8 HFE-7100 may be harmful if inhaled, swallowed or absorbed through skin. May cause skin, eye, and respiratory tract irritation. HFE-7100 is not considered a Hazardous chemical as defined by the OSHA Hazard Communication Standard, 29 CFR1910.1200

12.0 Module 10: Processing Technique – Dye Stains – Rhodamine 6G and RAM

12.1 Background and Theory

Dye stains are chemicals that are used to help visualize or enhance latent prints developed with other methods. They do not develop prints on their own and are generally applied to non-porous surfaces after fuming with cyanoacrylate ester.

Rhodamine 6G is an extremely efficient and highly fluorescent dye stain. Rhodamine must be visualized using an alternate light source and fluoresces between 450nm and 525nm.

RAM is a dye stain consisting of Rhodamine 6G, Ardrox and MBD (7-(P-Methoxybenzlamino-4Notrobenz-2-0xa-1, 3-Diazile). This combination allows the stain to fluoresce across a broad spectrum of wavelengths. Since it can be observed under various wavelengths, problematic backgrounds can be tuned out by using a wavelength that only fluoresces the fingerprint and not the background. As with rhodamine 6G, the print needs to have been previously developed by cyanoacrylate fuming before using the RAM stain.

12.2 Objectives, Principles, and Knowledge

- 12.2.1 Basic knowledge of the chemicals, the latent print matrices with which they react, potential safety hazards, and appropriate substrates for use.
- Demonstrate proper chemical application and preservation of developed 12.2.2 prints.
- Demonstrate proper mixing, use of controls, documentation, storage, and 12.2.3 disposal.

12.3 Health and Safety Hazards

- Rhodamine 6G, Ardrox P133D and MBD are classified as suspected animal 12.3.1 carcinogens, but sufficient evidence of human carcinogenicity has not been established. Rhodamine 6G and RAM are thought to be relatively safe when exposure is at low levels. They should never be inhaled or allowed to get into the eyes or mouth, as they are irritants. If this should occur, the eyes or mouth should be flushed with a generous amount of water and a doctor may be consulted.
- 12.3.2 Methanol, isopropanol, and petroleum ether are highly *flammable*. All three chemicals need to be handled carefully with gloves during mixing and use of the stain. Methanol and isopropanol are toxic in quantities as small as 30 ml and should not be allowed to come in contact with the skin, eyes or mouth. It is possible for methanol and isopropanol to be absorbed through the skin. If

methanol, isopropanol or petroleum ether come into contact with the eyes or the mouth, the area should be flushed with generous amounts of water and a doctor may be consulted. Inhalation of vapors should be kept at a minimum and the stain should be used in a fume hood or a well-ventilated area.

- 12.3.3 Eye protection, a lab coat, and gloves should be worn. All mixing and application of chemicals should be done inside a ventilated laboratory fume hood. Excess reagent shall be collected and placed in the hazardous waste container located in the fume hood.
- 12.3.4 Acetonitrile may be fatal if swallowed, inhaled or absorbed through skin. It affects cardiovascular system, central nervous system, liver and kidneys and may cause irritation to skin, eyes and respiratory tract. It is also a flammable liquid and vapor.

12.4 Reading and Practical Exercises

- 12.4.1 **Complete Module 10 Reading List** Trainee Trainer Date 12.4.2 Practical Exercise I – continue adding to the game or other activity you developed in Module 1. Incorporate at least three topics from your reading that you feel are particularly notable. Pass/Fail. 13.0 Module 11: Processing Technique – Gentian Violet/Crystal Violet

13.1 Background and Theory

Gentian Violet or Crystal Violet is a biological stain used to dye epithelial cells and fatty components of latent print residues an intense purple color. This reagent is a toxic carcinogen and should only be used in small quantities. It can be used on the sticky side of tape (duct tape, clear plastic tape, packaging tape, black electrical tape) and items that are greasy or oily, to enhance prints.

13.2 Objectives, Principles, and Knowledge

- 13.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- 13.2.2 Demonstrate proper chemical application and preservation of developed prints.
- 13.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.
- 13.3 Health and Safety Hazards
 - 13.3.1 Gentian Violet/Crystal Violet is a suspected human carcinogen. It is known to affect the kidney, ureter, bladder, and thyroid of animals. It can be harmful if inhaled, and is irritating to the eyes and skin.
 - 13.3.2 Gentian Violet should not be used in large amounts.

Trainee

13.3.3 A dust mask or respirator with dust filter should be used when working with the dry form. Gentian Violet should be prepared and used in a fume hood or well-ventilated area. The analyst should wear a lab coat, heavy-duty (non-disposable) gloves and safety glasses.

14.0 Module 12: Processing Technique – Iodine

14.1 Background and Theory

Iodine fuming is one of the oldest latent print methods still used today. It was advocated by Pierre Aubert in Paris in 1876. Iodine fuming exposes the evidentiary item to iodine fumes to develop latent prints. Iodine sublimates at low temperatures and the vapors are absorbed by the fats and oils in the latent print to turn it a yellow/brown color. Due to the sublimation of the iodine crystals, the print does not remain the yellow/brown color for very long. It is essential to photograph the print as quickly as possible after it is developed. It is considered a non-destructive technique.

14.2 Objectives, Principles, and Knowledge

- 14.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- 14.2.2 Demonstrate proper chemical application and preservation of developed prints.
- 14.2.3 Demonstrate proper use of controls, documentation, storage, and disposal.

14.3 Health and Safety Hazards

- 14.3.1 Safety is a serious concern when using the iodine fuming method. Iodine is toxic in any form. ALWAYS AVOID INHALING IODINE FUMES.
- 14.3.2 Iodine fumes may irritate the skin and damage the respiratory tract. Headaches that can last for several days may result from exposure to iodine. Long-term effects to the thyroid gland may result from exposure.
- 14.3.3 Adequate ventilation when using the method is mandatory as the fumes are corrosive to metals and may discolor other surfaces that they come in contact with.
- 14.3.4 Iodine shall be purchased in glass ampoules. The ampoules shall stay sealed until use.

15.0 Module 13: Processing Technique – Leuco Crystal Violet (LCV)

15.1 Background and Theory

Leuco Crystal Violet (LCV) is a biological stain that reacts to the heme group in blood to cause the impression residues to turn an intense purple color. It should only be applied to thoroughly dried blood impressions. LCV gives an almost instantaneous visualization of latent prints in existing ambient light. Resulting prints should be photographed as soon as possible to avoid over development of the background.

15.2 Objectives, Principles, and Knowledge

- 15.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- **15.2.2** Demonstrate proper chemical application and preservation of developed prints.
- 15.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

15.3 Health and Safety Hazards

- 15.3.1 Leuco Crystal Violet may be harmful by inhalation, ingestion or skin adsorption; may cause skin and eye irritation; may cause irritation to mucous membranes and upper respiratory tract.
- 15.3.2 Leuco Crystal Violet should not be used in large amounts.
- 15.3.3 A respirator should be used when working with the dry form. Leuco Crystal Violet should be prepared and used in a fume hood or well-ventilated area. The analyst should wear a lab coat, gloves and safety glasses.
- 15.3.4 In addition, analysts must be aware of the biological hazards associated with blood and other body fluids and take extra precautions to protect themselves.

16.0 Module 14: Processing Technique – Ninhydrin and ThermaNin

16.1Background and Theory

Ninhydrin (triketohydrindene hydrate) was first used in 1910 when Siegfried Ruhemann mistakenly prepared the compound. Ruhemann observed that the new compound reacted with amino acids to produce an intense purple color. Following Ruhemann's discovery, ninhydrin's use spread to analytical chemistry and biochemical applications. As early as 1916, the reaction with amino acids was used as an important test for the presence of protein in biological samples.

The technique is now one of the most popular methods for fingerprint detection on paper and other porous surfaces. The combination of heat and humidity accelerates the reaction of the proteins and amino acids with the ninhydrin.

Special formulations have been created that allow for use on thermal papers. These formulations do not utilize an external heat/humidity source, decreasing the darkening of the substrate.

16.2 Objectives, Principles, and Knowledge

- 16.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- 16.2.2 Demonstrate proper chemical application and preservation of developed prints.
- 16.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

16.3 Health and Safety Hazards

- 16.3.1 Gloves, lab coat, and eye protection shall be worn when using or mixing ninhydrin or ThermaNin. Precautions should also be taken to avoid inhalation of the fumes.
- 16.3.2 Hexane, is *extremely flammable* and the solution is to be used or mixed in a fume hood or in another well-ventilated area. Ensure that ninhydrin treated items are completely dry prior to exposing to the heat source.
- 16.3.3 Glacial acetic acid is *corrosive* and extremely irritating to the eyes and respiratory system. Avoid breathing the vapors and use in a fume hood or with adequate ventilation. Glacial acetic acid will cause burns if it comes in contact with skin.

- 16.3.4 2-Propanol, also known as Isopropyl Alcohol, is *flammable*. It is an irritant, and can be harmful if inhaled. Avoid breathing the vapors and use in a fume hood or with adequate ventilation.
- 16.3.5 ThermaNin is combustible. It forms explosive mixtures with air on intense heating in dry form. In event of a fire, ThermaNin will develop hazardous combustion gases or vapors.
- 16.3.6 Ethyl Acetate is hazardous if ingested or inhaled and slightly hazardous in case of contact with skin or eyes. The substance is toxic to mucous membranes and the upper respiratory tract. Repeated or prolonged exposure to the substance can damage the blood, kidneys, liver, or central nervous system (CNS).
- 16.3.7 HFE-7100 may be harmful if inhaled, swallowed or absorbed through skin. May cause skin, eye, and respiratory tract irritation. HFE-7100 is not considered a Hazardous chemical as defined by the OSHA Hazard Communication Standard, 29 CFR1910.1200.

17.0 Module 15: Processing Technique – Powder Development of Latent Prints

17.1 Background and Theory

The development of latent prints using powder involves the application of fine particles that physically adhere to the aqueous or oily components in latent print residue. Powder is one of the most common methods of latent print development utilized on non-porous and some semi-porous surfaces. It is also one of the oldest dating back to 1891. At that time, available substances including charcoal, lead powder, soot, and cigar ashes, were used for latent print development.

Most commercial powders use two essential elements to provide adhesion to latent print residue: pigment and binder. The pigment in the powder provides effective visualization, giving contrast against the background surface. The binder provides for maximum and preferential adhesion to latent print residue. There are many different kinds of powders including, black powder, magnetic powder, white powder, fluorescent powder, and various colored powders. No powder is universally applicable to all types of evidence.

There are several different types and sizes of brushes that can be used when applying fingerprint powders. Types include fiberglass, feather and animal hair brushes as well as magnetic wands. Certain types of brushes are used in conjunction with certain types of powders.

17.2 Objectives, Principles, and Knowledge

- 17.2.1 Understand the basic types of powders and brushes.
- 17.2.2 Knowledge of surfaces and environmental factors determining brush type, powder type, and color selection.
- 17.2.3 Understand the proper procedures for using different types of hair, fiberglass, and magnetic brushes.
- 17.2.4 Knowledge of equipment maintenance and safety procedures relative to powder development of latent prints.
- 17.2.5 Knowledge of lifting tape, gel lifters, hinge lifters, etc.

17.3 Health and Safety Hazards

17.3.1 Analysts are required to use the hoods or exhaust vents positioned at each workstation when performing powdering and lifting in the laboratory.

18.0 Module 16: Processing Technique – Physical Developer (PD)

18.1Background and Theory

Physical developer is a technique to detect fingerprints on wet or dry porous items, including papers, tapes, and cardboard. The process involves an oxidationreduction (redox) reaction whereby a solution of an iron salt reduces aqueous silver nitrate to finely divided metallic silver. The technique derives its name from the photographic developer used during film processing that undergoes a similar redox reaction. The physical developer develops the fingerprints as dark gray or black due to the adhesion of metallic silver particles on the fatty acid and lipid components of sweat residue. Prior to the introduction of physical developer in the 1970s, there was no reliable method for recovering prints from water-soaked documents.

18.2 Objectives, Principles, and Knowledge

- 18.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- 18.2.2 Demonstrate proper chemical application and preservation of developed prints.
- 18.2.3 Demonstrate proper mixing, documentation, storage, and disposal.

18.3 Health and Safety Hazards

- 18.3.1 Physical developer should only be used in a fume hood or well-ventilated area, as it is irritating to the respiratory tract.
- 18.3.2 Lab coats, gloves and safety glasses should be worn.
- 18.3.3 Standard laboratory protocol is followed for chemical handling.

19.0 Module 17: Processing Technique – Small Particle Reagent (SPR)

19.1 Background & Theory

Small particle reagent (SPR) is a technique used to develop latent fingerprints on moist, non-porous surfaces. Two types of SPR are available; the conventional formula consisting of molybdenum (IV) disulfide and commercially available white SPR. This technique relies on the adherence of fine particles, within a suspension solution, to the fatty components of latent print residue. This is the same approach as fingerprint powder. This technique was originally discovered by J.R. Morris in 1981.

19.2 Objectives, Principles, and Knowledge

- 19.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- **19.2.2** Demonstrate proper chemical application and preservation of developed prints.
- 19.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

19.3 Health and Safety Hazards

- 19.3.1 There does not appear to be any health hazards associated with small particle reagent, but the process should be monitored to see if there are any allergies.
- 19.3.2 Lab coats, gloves and safety glasses should be worn.

Trainee

19.3.3 Standard laboratory protocol is followed for chemical handling.

20.0 Module 18: Processing Technique – Sticky Side Powder/Sticky Side Powder Equivalent

20.1 Background and Theory

Sticky-side powder is a liquid fingerprint powder method that develops latent prints on adhesive surfaces. Sticky-side powder detects epithelial cells and fatty/oily components of latent print residue left when handling adhesive surfaces. Sticky side powder can be used on almost any tape, but works especially well on duct and electrical tape. Sticky side powder was developed in the mid-1990's when researchers at the National Identification Centre, Tokyo Metropolitan Police, were investigating methods for developing latent fingerprints on the adhesive side of tapes.

20.2 Objectives, Principles, and Knowledge

- Basic knowledge of the chemical, the latent print matrices with which it reacts, 20.2.1 potential safety hazards, and appropriate substrates for use.
- Demonstrate proper chemical application and preservation of developed 20.2.2 prints.
- 20.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

20.3 Health and Safety Hazards

- When using the powder in the dry form, precautions should be taken to 20.3.1 prevent the powder from becoming airborne and possibly inhaled.
- 20.3.2 Lab coats, gloves, and safety glasses should be worn.
- 20.3.3 Standard laboratory protocol is followed for chemical handling.

21.0 Module 19: Processing Technique – Sudan Black

21.1 Background and Theory

Sudan Black was originally used in laboratories for biological testing or chemical screening for fatty components. Sudan black was initially reported to detect the oily/fatty components of fingerprint residue by Misui, Katho, Shimada, and Wakasugi of the Criminal Science Laboratory in Nagoya-shi, Japan in 1980. It is a dye stain that produces a blue-black product and is used to develop latent fingerprints on non-porous waxy substrates and surfaces contaminated with grease, dried beverages, and food residue. Sudan black will also enhance latent fingerprints developed by cyanoacrylate fuming.

21.2 Objectives, Principles, and Knowledge

- 21.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
- 21.2.2 Demonstrate proper chemical application and preservation of developed prints.
- 21.2.3 Demonstrate proper mixing, use of controls, documentation, storage, and disposal.

21.3 Health and Safety Hazards

- 21.3.1 The Sudan Black working solution contains methanol. Methanol is toxic in quantities as small as 30 ml and should not be allowed to come in contact with the skin, eyes or mouth. It is possible for methanol to be absorbed through the skin. If methanol comes into contact with the eyes or mouth, the area should be flushed with generous amounts of water and a doctor may be consulted. Inhalation of methanol vapors should be kept at minimum.
- 21.3.2 Sudan Black should be used in a fume hood or well-ventilated area.
- 21.3.3 Lab coats, gloves and safety glasses should be worn.
- 21.3.4 Standard laboratory protocol is followed for chemical handling.

21.4 Reading and Practical Exercises

Revision 8 Issue Date: 12/29/2021 Issuing Authority: Quality Manager

22.0 Module 20: Processing Technique – Cyanoacrylate Ester (Super Glue®)

22.1 Background and Theory

Cyanoacrylate ester (CAE), also known as "Super Glue®", is a technique used to develop latent fingerprints on virtually all non-porous and some semi-porous surfaces, including glass, metal, coated papers, and all forms of plastics. This method is especially effective on rough or textured surfaces. CAE processing also prepares the evidence for the acceptance of powder and dye-stains that may enable further visualization of the latent prints. Super Glue® was created in the 1950's by researchers who were trying to develop an acrylic polymer for the aircraft industry. In the late 1970's, researchers discovered its latent fingerprint development use, using the fumes of the glue. Shortly thereafter, the Bureau of Alcohol, Tobacco, and Firearms introduced this technique to North America and it quickly gained acceptance worldwide.

CAE fuming works by quickly bonding the CAE monomers to the latent print residues. The monomer on the fingerprint residue reacts with another CAE monomer in the vapor phase to form a dimer on the print. This reacts with another monomer to eventually form a polymer of CAE molecules. The overall development time is fast, especially when volatilization of the glue is accelerated (via heating or pretreatment).

- 22.2 Objectives, Principles, and Knowledge
 - 22.2.1 Basic knowledge of the chemical, the latent print matrices with which it reacts, potential safety hazards, and appropriate substrates for use.
 - 22.2.2 Demonstrate ability to properly utilize the CAE fuming chambers, wands, and vacuum chambers.
 - 22.2.3 Demonstrate proper preservation of developed prints.
 - 22.2.4 Demonstrate proper use of controls, documentation, storage, and disposal.
- 22.3 Health and Safety Hazards
 - 22.3.1 CAE fuming should only be conducted in a filtered chamber or well-ventilated area. Precautions should be taken to avoid inhaling or allowing the vapors to contact the eyes, as the vapors can be irritating to the eyes, nose, and throat. Persons wearing contact lenses should not open CAE chambers without proper precautions. Non-vented goggles should be worn.

Latent Print Examiner Training Manua	I	Revision 8
Module 20: Processing		Issue Date: 12/29/2021

Ester (Super Glue®)		

- 22.3.2 Precautions include properly sealed CAE chambers and evacuating the fumes from the chambers prior to removal of the questioned and test surfaces.
- 22.3.3 Gloves should be worn to prevent the cyanoacrylate from contacting the skin. If liquid glue is allowed to contact the skin, adhesion may result. If the skin sticks together, immerse affected areas in warm water. This will loosen the skin so that it can be gently pulled apart.

22.4 Reading and Practical Exercises

23.0 Module 21: Digital Imaging

23.1 Background and Theory

Latent print images are frequently captured, processed and stored using digital devices. All of the techniques used in digital image processing have their roots in traditional photography and mathematics. The use of digital image processing can yield information not readily apparent in the original image and can assist in drawing a conclusion that might not have been reached otherwise. Image processing provides for higher image clarity and contrast.

23.2 Objectives, Principles, and Knowledge

- 23.2.1 Understand the capabilities and limitations of specific technologies that relate to digital imaging and storage of latent and inked prints.
- 23.2.2 Understand digital processing techniques using Adobe Photoshop to improve the visualization of latent print images.
- 23.2.3 Proficiency in the use of processing techniques to include, but not limited to: color reversal, position reversal, layers, contrast, image calibration/resolution, digital filters, and creation of enlargements.
- 23.2.4 Proficiency in the use of the current digital imaging system.

23.3 Health and Safety Hazards

23.3.1 As with other electrical appliances, guard against electrical shock. This can be accomplished by ensuring that all connections are proper and that no loose, damaged, or frayed wires exist.

23.4 Reading and Practical Exercises

- 23.4.1 Complete Module 21 Reading List
- TraineeTrainerDate23.4.2The Trainee should attend a Digital Imaging course. (20 hour minimum -
attach copy of certificate).

Trainee Trainer

23.4.3 Practical Exercise I – Trainer led lesson on digital image processing to include a demonstration of commonly utilized techniques. The Trainee shall practice processing techniques on the training images. Processed images will be evaluated by the Trainer and the Trainee will discuss with the Trainer the reasons they chose specific techniques. Pass/Fail.

24.0 Module 22: Biology and Physiology of Friction Ridge Skin

24.1 Background and Theory

A thorough understanding of the anatomy and physiology of friction ridge skin allows examiners to correctly analyze latent print impressions. Elements of biology and physiology explain why friction ridge skin is unique, why features of the skin persist, how the features of the skin age, how the skin responds to injury and why scars that form are unique. Understanding the pliability of friction ridge skin and how the skin reacts when it contacts a surface also provides valuable assistance during the examination of friction ridge impressions.

24.2 Objectives, Principles, and Knowledge

- 24.2.1 Understand the biology and physiology of friction ridge skin.
- 24.2.2 Understand the basic foundations of the science of friction ridge identification (persistence and discriminability).
- 24.2.3 Understand the basic anatomy and terminology of the hands and feet.
- 24.2.4 Understand the general chemical composition of human perspiration as a means of understanding the composition of latent print residue.
- 24.2.5 Knowledge of genetic abnormalities of friction ridge skin (e.g. dysplasia, dissociated ridges).
- 24.2.6 Knowledge of alteration and mutilation of friction ridge skin.

24.3 Health and Safety Hazards

24.3.1 N/A

25.0 Module 23: Recording Inked Fingerprints, Palm Prints, and Footprints

25.1 Background and Theory

Recording inked fingerprints, palm prints and footprints is necessary for latent print examinations. These impressions can be made using a number of techniques, including traditional ink, Livescan, and powder/adhesive lift methods. Care and determination in recording the prints should always be exercised in order to obtain the best quality recordings for classification and/or comparison.

25.2 Objectives, Principles, and Knowledge

- 25.2.1 Understand the various methods for recording known friction ridges for criminal history or personal identification including knowledge of chemical (inkless) systems, printer's ink, the black powder/adhesive lift (Handiprint®) method and electronic capture systems (Livescan).
- 25.2.2 Understand the quality of friction ridge detail produced by each method.
- 25.2.3 Understand the benefits associated with obtaining victim/elimination prints and complete friction ridge exemplars (major case prints).
- 25.2.4 Understand the proper method of completing fingerprint and palm print card information, sequence for recording fingers, and method of printing plain impressions.
- 25.2.5 Demonstrate ability to properly use ink and brayer to record fingerprints, palm prints, and footprints (including equipment maintenance).
- 25.2.6 Demonstrate ability to properly record complete friction ridge exemplars (major case prints).
- 25.3 Health and Safety Hazards
 - 25.3.1 N/A

26.0 Module 24: Friction Ridge Pattern Recognition and Interpretation

26.1 Background and Theory

Friction ridge identification and classification has a long history rooted in scientific research and empirical observations. Various classification systems including Henry, Vucetich, and National Crime Information Center (NCIC), have been successfully used over the past 100 years. Today's classification systems rely mainly upon computers to digitize, categorize, recall, and identify matching tenprint cards. NCIC became operational in 1967.

While the use of computers has modernized fingerprint classification within the criminal justice system and forensic science, it is important that latent print examiners be able to recognize and articulate the various patterns and subpatterns, their use in analysis and comparison, as well as the history behind them.

- 26.2 Objectives, Principles, and Knowledge
 - Understand common terminology and definitions associated with friction 26.2.1 ridge pattern recognition (arch, loop, and whorl).
 - 26.2.2 Know frequency rates for each major fingerprint pattern type and which patterns are most likely to occur on which fingers.
 - 26.2.3 Ability to differentiate between pattern types.
 - 26.2.4 Awareness and understanding of the Henry Classification System to include: origin, FBI extensions, pattern interpretation, & parts of classification.
 - 26.2.5 Awareness and understanding of other classification systems (NCIC Classification System, American System, and the Vucetich System)
 - 26.2.6 Understand friction ridge formations as they relate to recognition, interpretation, and identification.
- 26.3 Health and Safety Hazards

27.0 Module 25: Introduction to Latent Prints and the State of the Science

27.1 Background and Theory

Forensic scientists are entrusted with a great amount of responsibility. The public and the criminal justice system expect that forensic scientists be unbiased, intelligent, and thorough. In order to do so, scientists must take their responsibility seriously and uphold the ethics and values required for their position. Over the past decade, the news has been filled with stories of incompetence and out right misconduct. Crime labs in nearly every state have been affected and, in turn, the field of forensic science is facing more and more challenges. We are seeing them on multiple fronts from both the court system, in the form of Daubert hearings, to legislation requiring accreditation. Many resources are being put into exploring the state of the science and what the path forward should look like. From the 2009 NAS report on Strengthening Forensic Science in the United States to the formation of the Organization of Scientific Area Committees (OSACs), the field is rapidly changing.

- 27.2 Objectives, Principles, and Knowledge
 - 27.2.1 Knowledge of the professional duties, moral obligations, and code of ethics for Latent Print Examiners.
 - 27.2.2 Knowledge of the various professional organizations and certifications.
 - 27.2.3 Be familiar with the NAS report and the impact it is having on the field.
 - 27.2.4 Be familiar with the Friction Ridge OSAC and its activities.
- 27.3 Health and Safety Hazards
 - 27.3.1 N/A

28.0 Module 26: Human Factors

28.1Background and Theory

The term "human factors" as it applies to forensic science, is the scientific discipline concerned with the understanding of interactions among humans and other elements of the forensic system including products, decisions, procedures, workspaces, and the overall environment encountered at work. It advances an understanding of the nature of errors in complex work settings and attempts to mitigate them by applying theory, principles, data, and method design to optimize overall performance and improve cognitive abilities with respect to judgment and decision making. Human factors research has its roots in post-World War I aviation psychology and was first applied to forensic science, and latent print examination in particular, in the mid 2000's. By 2008, the National Institute of Justice (NIJ) Office of Investigative and Forensic Sciences (OIFS) and the National Institute of Standards and Technology's (NIST's) Law Enforcement Standards Office (OLES) had put together an Expert Working Group on Human Factors in Latent Print Analysis. The Organization of Scientific Area Committees (OSAC) currently has a Human Factors Committee established to provide advice and guidance on human factors issues in forensics.

28.2 Objectives, Principles, and Knowledge

- 28.2.1 Develop an understanding of the nature of errors in latent print examination.
- 28.2.2 Identify the various human factors that lead to errors.
- 28.2.3 Understand the role of human factors and their contributions to errors in latent print analysis.
- 28.2.4 Understand how environmental conditions affect the quality of latent print examinations.
- 28.2.5 Ability to define the different types of bias: cognitive bias, confirmation bias, contextual bias, etc.
- 28.2.6 Ability to define the different types of errors: false positive, false negative, etc.

29.0 Module 27: Analysis, Comparison, Evaluation, and Verification (ACE-V)

29.1 Background and Theory

The scientific method is a method of research in which a problem is identified, relevant data is gathered, and a hypothesis is formulated from the data and then tested. In forensic science, it is imperative to have a scientific technique for examination. Doing so ensures that evidence is treated equally and conclusions are reliable and unbiased. The latent print section utilizes ACE-V as part of the examination methodology. ACE-V is an acronym that stands for analysis (A), comparison (C), evaluation (E) and verification (V). It is the process that latent print examiners utilize to reach a conclusion about a comparison examination.

Huber initially discussed ACE-V in 1959 when describing the philosophy of science and the correct use of the scientific method. Huber described hypothesis testing as analyzing, comparing, and evaluating and noted that verification was needed. In 1979, David Ashbaugh noted the applicability of the methodology to the latent print comparison process. In 1998, during the first Daubert hearing on fingerprint evidence, the members of the fingerprint community recognized the need to better articulate how they came to their conclusions. ACE-V was determined to be one such way to do so. Today, ACE-V has gained widespread recognition and implementation within the field.

29.2 Objectives, Principles, and Knowledge

- 29.2.1 Understand the scientific methodology and its application to friction ridge examination.
- 29.2.2 Understand the individual friction ridge structure (e.g., continuity, texture, pore, and edge definition) for determining the existence of individualizing details.
- 29.2.3 Understand friction ridge characteristics (dots, ridge endings, and bifurcations), the varying definitions/interpretations assigned to combinations of those three ridge characteristics, and how they may be utilized in effecting identification.
- 29.2.4 Understand the value of incipient ridge characteristics for use in latent print comparison/identification.
- 29.2.5 Understand the importance of elimination prints and the utility of completing comparisons of known individuals (e.g. victims) before searching a print in the MBIS system.

Module 27: Analysis,		Issue Date: 12/29/2021
Comparison, Evaluation, and	Page 69 of 104	Issuing Authority: Quality Manager
Verification (ACE-V)		

- 29.2.6 Ability to recognize and utilize ridge flow configurations (size, pattern, focal points, etc.), scars, creases, and other friction ridge characteristics.
- 29.2.7 Ability to recognize, and if possible, determine the area from which the latent fingerprints, palm prints, and foot/toe prints originated.
- 29.2.8 Understand the nature of color reversals (entire print) and changes (within the same print) and the ability to properly analyze these occurrences when they are encountered in latent print comparisons.
- 29.2.9 Understand the effects of pressure distortion, slippage, overlays, pre- and post- deposit artifacts (surface scratches, soil, brush strokes, etc.), and the ability to properly analyze such disturbances/distortion.
- 29.2.10 Understand the different policies and standards that exist regarding what constitutes friction ridge identification in the U.S. and other countries and why no minimum number of ridge characteristics can be defined to effect an identification (i.e., positive opinion based on personal empirical experience in examining and comparing latent prints).
- 29.2.11 Knowledge of simultaneous or adjacent impressions and their value for identification.
- 29.2.12 Ability to analyze fragmentized friction ridge detail to determine its value (comparison/identification, value/no value).
- 29.2.13 Knowledge of various methods used to record known friction ridge impressions and the ability to properly evaluate ridge structure based on each method.
- 29.2.14 Ability to properly conduct a comparison.
- 29.2.15 Ability to render an accurate source conclusion (identification, inconclusive, exclusion).
- 29.2.16 Understand the necessity for verification by another qualified latent print examiner.
- 29.2.17 Understand the role of quality assurance measures in friction ridge examination.
- 29.2.18 Awareness of the impacts resulting from an erroneous conclusion.
- 29.2.19 Awareness of basic statistical models and the potential for their integration into the current friction ridge identification procedures.
- 29.3 Health and Safety Hazards 29.3.1 N/A

29.6 Comparison Competency Test- Trainee will independently analyze and compare a mock case. Prints may consist of palm prints, low minutia prints, distorted prints, and non-matching prints. This competency test will be entered into ILIMS, and as such, Trainee will need to complete all appropriate documentation and attachments, and issue a report.

29.7 Supervised Cases – Complete 20 Supervised Comparison Cases. Trainee shall record all case numbers, associated stats, and the identity of the supervising analyst.

Latent Print Examiner Training Manual Module 27: Analysis, Comparison, Evaluation, and Page 72 of 104 Verification (ACE-V) Revision 8 Issue Date: 12/29/2021 Issuing Authority: Quality Manager

30.0 Module 28: Case Management and Reporting for Comparison and/or MBIS

30.1 Background and Theory

Forensic scientists are responsible for documenting the activities, methods, and results of their examinations in the case record. Written case records are recorded contemporaneously in ILIMS. All case documentation should be such that another qualified Latent Print Examiner could read the documentation and replicate the work. MBIS searches are also documented in ILIMS with supporting documentation attached so that they too may be evaluated by another qualified analyst.

30.2 Objectives, Principles, and Knowledge

- 30.2.1 Knowledge of and the ability to demonstrate proper procedures for maintaining chain of custody (documentation and physical control).
- 30.2.2 Ability to navigate and query the various databases for location of criminal history records, fingerprint and palm print cards.
- 30.2.3 Ability to navigate and query ILIMS for latent print comparison and/or MBIS cases.
- 30.2.4 Ability to demonstrate proper procedures for documentation of comparison casework. Documentation shall be such that another qualified Latent Print Examiner could evaluate what was done and replicate any comparisons.
- 30.2.5 Knowledge of and the ability to demonstrate proper procedures for reporting latent print comparison and MBIS examination findings in an accurate, concise, and clear manner.

31.0 Module 29: Court Procedures, Related Laws, Expert Testimony, Criminal and Civil Procedures Applicable to Latent Prints

31.1 Background and Theory

One of the most important parts of a forensic scientist's job is ensuring that the evidence that has been processed and evaluated is acceptable to the court system. ISPFS has numerous procedures to help ensure that evidence is handled and processed in an acceptable manner. It is also important to ensure that analysts are properly trained and prepared to testify as an expert witness within the field.

There are a number of important statutes and legal decisions that impact fingerprint testimony and the admission of evidence. It is important for latent print examiners to be familiar with some of the Federal Rules of Evidence, including Rules 701, 702, 703, and Rule 16. Important court cases include People v. Jennings, Frye v. United States, Daubert v. Merrel Dow Pharmaceuticals, US v. Byron Mitchell, US v Llera Plaza, and Mayfield v United States.

- 31.2 Objectives, Principles, and Knowledge.
 - 31.2.1 Understand the role of expert witness testimony.
 - 31.2.2 Knowledge of factors regarding the admissibility of evidence.
 - 31.2.3 Knowledge of relevant court cases and case histories.
 - 31.2.4 Understand the rules of discovery and evidence.
 - 31.2.5 Knowledge of applicable legal challenges to admissibility.
 - 31.2.6 Understand critical challenges to the discipline.
 - 31.2.7 Understand the advantages and disadvantages of different court chart types/methods (points, area bubbles, power point).
 - 31.2.8 Select appropriate prints and individual ridge characteristics for charting and create court charts, and utilize the digital imaging system to create court charts/exhibits.
 - 31.2.9 Ability to verbally articulate the friction ridge examination process and any resulting conclusions.
- 31.3 Health and Safety Hazards
 - 31.3.1 N/A

31.4 Reading and Practical Exercises

31.4.1 Complete ISP FS core training court module Trainee Trainer Date 31.4.2 **Complete Module 29 Reading List** Trainee Trainer Date 31.4.3 The Trainee should attend a court room testimony training class when available (attach copy of certificate). Trainee Trainer Date 31.4.4 Practical Exercise I – Write a three to five page paper on a recent court development as it relates to fingerprints. Pass/Fail. Trainee Trainer Date 31.4.5 Practical Exercise II - Write one to two paragraphs outlining the arguments, decisions, and impact of each on the Science of Friction Ridge Analysis for each of the following court cases: Daubert v. Merrel Dow Pharmaceuticals, US v. Byron Mitchell, US v Llera Plaza, and Mayfield v United States. Pass/Fail. Date Trainee Trainer 31.4.6 Practical Exercise III – Prepare your curriculum vitae utilizing the appropriate template. Pass/Fail. Trainer Trainee Date Practical Exercise IV – Prepare a list of court qualifying questions related to 31.4.7 latent print processing or comparison and provide sample answers to those questions that could be presented in a court of law. Pass/Fail. Processing Trainee Trainer Date Comparison Trainee Trainer Date 31.4.8 Practical Exercise V – Discuss court dress code, demeanor, and etiquette with your trainer. Explain to your trainer how to proceed if there is an objection and what the protocol is for referring to your notes. Discuss with your trainer what a "leading question is" and why it is important to remain accurate and transparent. Have your trainer go through your qualifying questions. Practice giving answers in a formalized manner. Pass/Fail. Trainee Trainer Date

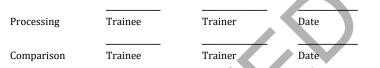

Latent Print Examiner Training Manual Module 29: Court Procedures, Related Laws, Expert Page 76 of 104 Testimony, Criminal and Civil Procedures Applicable to Latent Prints

Revision 8 Issue Date: 12/29/2021 Issuing Authority: Quality Manager

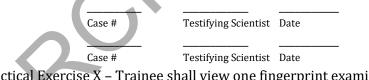

31.4.9 Practical Exercise VI–Your trainer will provide you with the set of direct questions that will be used during your mock court (NOTE: there are separate questions for processing and comparison/MBIS). Devise answers to these questions and practice your answers. Set up a meeting with your trainer and one other analyst to go over the set of questions given to you. Practice giving answers in a formalized manner. Pass/Fail.

31.4.10 Practical Exercise VII – Satisfactorily complete a mock court (NOTE: processing and comparison are separate). Mock court will include qualifying questions, direct examination, cross-examination, and re-direct. It will also include case specific testimony. The analyst will utilize a comparison chart of their own making during the comparison mock court. Pass/Fail.

- 31.4.11 Practical Exercise VIII Trainee shall generate a list of MBIS related court qualifying questions and provide sample answers to those questions that could be presented in a court of law. Pass/Fail.
- TraineeTrainerDate31.4.12Practical Exercise IX Trainee shall observer attend the testimony of two
forensic scientists. Pass/Fail.

31.4.13 Practical Exercise X – Trainee shall view one fingerprint examiner testimony video from You Tube. Trainee shall take note what they thought the examiner did well and what they thought they could improve upon. They will then discuss their critique with their trainer. Pass/Fail.

32.0 Module 30: Multimodal Biometric Identification System (MBIS)

32.1 Background and Theory

Fingerprints are used as the foundation for criminal history records throughout the world. In 2016, the FBI's database was estimated to contain over 100 million fingerprint cards with the Idaho database having a little over half a million persons on file. Databases on all levels continue to grow with tens of thousands of individuals added to these repositories daily. These sophisticated computer filed repositories are referred to as an Automated Fingerprint Identification System (AFIS) or Multimodal Biometric Identification System (MBIS). AFIS/MBIS is essentially a two part system: the ten-print system and the latent print system. The ten-print system is tasked with identifying sets of inked or Livescan fingerprints for criminal identification or employment purposes. The latent system is tasked with solving crimes through fingerprints recovered from crime scenes or from items of evidence.

Idaho is a member of the Western Identification Network, Inc. (WIN). WIN was formed in 1988 to create a multi-state AFIS network. The members of WIN are Alaska, Montana, Oregon, Washington, Nevada, Utah, Wyoming, California and Idaho. WIN offers access to 20 million fingerprint records held within the western United States.

32.2 Objectives, Principles, and Knowledge

- 32.2.1 Understand automation technology and theory of operation to include: The history of the development of friction ridge automation technology; Theory of the operation of friction ridge automation technology, to include an understanding of distortion that may occur when three-dimensional friction ridge skin is captured as a two-dimensional image.
- 32.2.2 Understand the function and use of image capture to include: Types of friction ridge recordings (e.g. rolled, flat, simultaneous, palm); Methods of friction ridge capture (e.g. ink, livescan); Types of capture devices (e.g. livescan, flatbed, camera); Point of capture variables (e.g. condition of fingers, condition of platen, rolling speed, movement); Control measures needed to achieve quality friction ridge images (e.g. scan resolution, compression rate, equipment maintenance, calibration); Procedures for addressing amputations, temporary injuries, skin conditions, and rescans.

Latent Print Examiner Training ManualRevision 8Module 30: MultimodalIssue Date: 12/29/2021Biometric Identification SystemPage 78 of 104(MBIS)Issuing Authority: Quality Manager

32.2.3 Understand the function and use of Multimodal Biometric Identification Systems (MBIS) to include: MBIS process related to acquisition, classification, searching, storage, retrieval, identification, and final reporting of friction ridge records; Friction ridge search criteria (e.g. designated finger search, how many fingers, palm areas); Importance of quality assurance on maintaining the integrity of friction ridge data; Quality controls that ensure completeness, image quality, and data integrity. 32.2.4 Gain a working knowledge of the NEC Multimodal Biometric Identification System (MBIS) and the Integrated Automated Fingerprint Identification System (IAFIS) to include: Who handles component maintenance and calibration; System requirements and limitations including text data fields, fingerprint and palm print quality, finger sequence and image replacement, image rotation, and toleration for pattern interpretation; Minutia recognition, placement, rotation, ridge counts, and other minutiae factors related to searching and matching; Limitations of system interoperability; Integration of friction ridge image, mug shot, scars, marks, tattoos, minutiae, other biometrics, as well as personal descriptors, and criminal history information: Search parameters, pattern classification and referencing, minutiae extraction, search algorithms, significance in the range of candidate scores, threshold scoring, and candidate list comparisons, matching; AFIS search capabilities in regards to latent print vs. ten print, ten print vs. latent print, latent print vs. latent print, ten print vs. ten print, and palm print vs. palm print; "Lights out" processing of searches and mobile search capabilities; Logical search progression (i.e. state, regional, national); Filtering criteria used to establish logical candidates (e.g. finger position, sex, classification, race, offense, geographic location); Search result contents (e.g. ranked order, unique identifier, finger or palm position); Differences between AFIS digital images and original friction ridge impressions (e.g. potential loss of quality due to compression of image, monitor resolution, capture resolution); Printer technology limitations vs. examinations from original friction ridge documents (e.g. paper quality, inked fingerprint cards); AFIS processes related to latent print searches; Various search options among databases within the system (e.g. image, feature); Latent Print Examiner Training Manual **Revision 8** Module 30: Multimodal Issue Date: 12/29/2021 Biometric Identification System Page 79 of 104 Issuing Authority: Quality Manager (MBIS)

Manual and automatic encoding of minutiae;

File penetration benefits and liabilities of partial vs. full data base searches; Record authentication processes (e.g. correct association of name, unique identifier, friction ridge images, and criminal history record).

32.3 Health and Safety Hazards

32.3.1 N/A

32.4 Reading and Practical Exercises

- 32.4.1 Complete Module 31 Reading List
- Trainee Trainer Date 32.4.2 The Trainee will review the AFIS Course Binder and satisfactorily and pass the associated test. Trainee Trainer Grade 32.4.3 Practical Exercise I - Complete 20 MBIS searches through ID/WIN and the FBI working as "the hands of the Trainer" as defined by the ISPFS Quality/Procedure Manual. Pass/Fail. Trainee Trainer Date 32.4.4 MBIS Competency Test: Trainee will independently search 5 mock latent prints through the Multimodal Biometric Identification System. Competency test prints may consist of palm prints, low minutia prints, distorted prints, and non-matching prints. This competency test will be entered into ILIMS, as such, Trainee will need to document searches, attach proper MBIS documentation, and issue a report. Trainee Trainer Date 32.5 Written Test - Module 31 Trainee Trainer Date Grade

33.0 Module 31: DNA Database Fingerprint Comparison

33.1 Background and Theory

Friction ridge identification and classification has a long history rooted in scientific research and empirical observations.

Various classification systems have been used over the past 100 years. Today's classification systems rely mainly upon computers to digitize, categorize, recall, and identify matching 10-print cards.

Examiners must be able to recognize and articulate the various patterns and subpatterns and understand their use in analysis and comparison.

The scientific method is a method of research in which a problem is identified, relevant data is gathered, and a hypothesis is formulated from the data and then tested. In forensic science, it is imperative to have a scientific technique for examination. Doing so ensures that evidence is treated equally and conclusions are reliable and unbiased. The latent print section utilizes ACE-V as part of the examination methodology. ACE-V is an acronym that stands for analysis (A), comparison (C), evaluation (E) and verification (V). It is the process that latent print examiners utilize to reach a conclusion about a comparison examination.

33.2 Objectives, Principles, and Knowledge

- 33.2.1 Understand the basic biology and physiology of friction ridge skin.
- 33.2.2 Understand the basic foundations of the science of friction ridge identification (persistence and uniqueness).
- 33.2.3 Understand common terminology and definitions associated with friction ridge pattern recognition (arch, loop, and whorl).
- 33.2.4 Ability to differentiate between pattern types.
- 33.2.5 Understand friction ridge characteristics (dots, ridge endings, and bifurcations) the varying definitions/interpretations assigned to combinations of those three ridge characteristics, and how they may be utilized in effecting identification.
- 33.2.6 Ability to successfully analyze and compare known fingerprint cards to plain inked fingerprint impressions.
- 33.2.7 Ability to render an accurate conclusion (identification, inconclusive, exclusion).
- 33.2.8 Understand the necessity for verification by another qualified latent print examiner.
